$\mathbf{ET_{F}X}$ - α

LATEX Meets Wolfram

IFT_EX- α is a IFT_EX package which incorporates the typesetting ease and control of IFT_EX with the power of the Wolfram Language. The goal of IFT_EX- α is to provide the most complete, powerful and self-sufficient typesetting environment.

LATEX- α is a work in progress. Please keep checking back for updates by clicking the title.

\usepackage{latexalpha}

Calculations

IATEX- α allows for inline calculations, making scientific or mathematical document typesetting simpler and more streamlined. The examples below show that IATEX- α has the full capabilities of the Wolfram Language, and thus knows mathematical constants, can solve integrals and can differentiate symbolically.

A basic example:

 $3+4=\calc{3+4}$

Typed in LATEX Calculated by the Wolfram Cloud
$$\overbrace{3+4}$$
 = $\overbrace{7}$

Some more advanced examples:

 $3\times \sin\left(\frac{\pi c}{4}\right) = \frac{3*4 \sin[Pi/4]}$

$$3 \times 4 \sin\left(\frac{\pi}{4}\right) = 6\sqrt{2}$$

 $\int_{10}^{35} e^{5x} dx=\int_{10}^{35} e^{5x} d$

$$\int_{10}^{35} e^{5x} dx = 2.00708 \times 10^{75}$$

 $\frac{d}{dx}x^2\log(x)=\operatorname{CD}[x^2 \log[x], x]}$

$$\frac{d}{dx}x^2\log(x) = x + 2x\log(x)$$

 $\cos(\frac{\pi c_{\pi}}{4})\approx $\sum_{n=0}^3 \frac{(-1)^n \left(\frac{\pi c_{\pi}}{4}\right)^{2n} }{(2n)!} = \calc_{\pi}[Table_{-1}^n (Pi/4)^(2 n)/((2 n)!), {n, 0, 3}]] // N}$

$$\cos(\frac{\pi}{4}) \approx \sum_{n=0}^{3} \frac{(-1)^n \left(\frac{\pi}{4}\right)^{2n}}{(2n)!} = 0.707103$$

Using the Greek Alphabet

The \cline{calc} command is equipped with a special function to use greek characters, $\cline{Greek[}$].

\[(\lambda +4)^3 (\lambda -1)=
\calc{Expand[(Greek[Lambda] +4)^3 (Greek[Lambda] -1)]}\]

$$(\lambda + 4)^3(\lambda - 1) = \lambda^4 + 11\lambda^3 + 36\lambda^2 + 16\lambda - 64$$

For capital greek letters, prepend "Capital". For example, Greek [CapitalOmega] becomes Ω .

Solving Equations

IATEX- α allows for equations with multiple solutions to be solved within IATEX documents with the command \solve{equation to be solved}{variable to be solved for}. For example,

\$\omega^2=1\$ has solutions
\solve{Greek[Omega]^2==1}{Greek[Omega]}

 $\omega^2 = 1$ has solutions

$$\omega = -1$$
$$\omega = 1$$

$$3 K^2 - 4 K M y^2 + M^2 y^4 = 0$$
 has roots $solve{3 K^2 - 4 K M y^2 + M^2 y^4 == 0}{y}$

$$3K^2 - 4KMy^2 + M^2y^4 = 0$$
 has roots

$$y = -\frac{\sqrt{K}}{\sqrt{M}}$$

$$y = \frac{\sqrt{K}}{\sqrt{M}}$$

$$y = -\frac{\sqrt{3}\sqrt{K}}{\sqrt{M}}$$

$$y = \frac{\sqrt{3}\sqrt{K}}{\sqrt{M}}$$

Some Useful Wolfram Language Functions

N[]

If you wrap your calculation in this function it will return a numerical value. For example, e^2 would become 7.38906 .

ScientificForm[Expression, Precision]

This will give you a value in scientific notation. For example ScientificForm [142342123342., 3] will become 1.42×10^{11} .

Graphics

the \graphic command generates a graphic and saves it to your directory to be used later in your IATEX document.

```
\proonup {Tan[x], {x, 0, 2*Pi}]}{tan}
```

```
\begin{figure}[h!]
\centering
\includegraphics[width=0.6\textwidth]{tan.png}
\caption{Plot of $\tan(x)$ generated with the Wolfram API}
\end{figure}
```

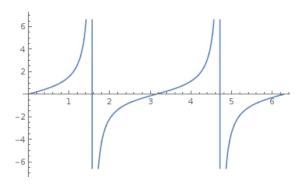

Figure 1: Plot of tan(x) generated with the Wolfram API

```
\label{listPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlot[firstPlo
```

```
\begin{figure}[h!]
\centering
\includegraphics[width=0.6\textwidth]{plot.png}
\caption{Some points plotted with the Wolfram API}
\end{figure}
```

Additionally, $\mathbf{E}^{\mathbf{T}}\mathbf{E}^{\mathbf{X}-\alpha}$ supports error bars.

```
\graphic{ErrorListPlot[{{0.5,0.1},{1,0.1},{1.7,0.5},{2,0.1},{3,0.2}}]}{errorplot}
```

```
\begin{figure}[h!]
\centering
\includegraphics[width=0.6\textwidth]{errorplot.png}
\caption{Error Plot generated with the Wolfram API}
\end{figure}
```

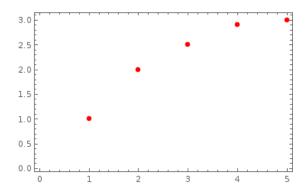

Figure 2: Some points plotted with the Wolfram API

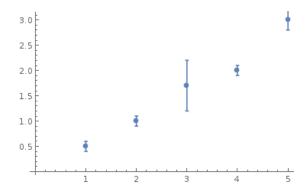

Figure 3: Error Plot generated with the Wolfram API

The \grayhic command is (as the name would suggest) not restricted to scientific or mathematical plots.

\graphic{GeoGraphics[Frame->True]}{map}

\begin{figure}[h!]
\centering
\includegraphics[width=0.6\textwidth]{map.png}
\caption{A map}
\end{figure}

Figure 4: A map

Using Data Files

If you would like to make a plot using data stored in files on your computer, you can use $\mathbf{L}^{\mathbf{T}}\mathbf{F}\mathbf{X}$ - α 's \dataplot TXT command.

The file data.txt contains a list of numbers generated using the Wolfram

```
Language. It's contents are shown here for reference: {{1, 4.23012}, {2, 5.21578}, {3, 9.69427}, {4, 16.79}, {5, 16.6168}, {6, 27.1912}, {7, 8.96403}, {8, 19.9478}, {9, 27.887}, {10, 14.6491}, {11, 30.6462}, {12, 12.2211}, {13, 44.8838}, {14, 30.3541}, {15, 38.5018}, {16, 44.3764}, {17, 63.9962}, {18, 87.8068}, {19, 69.8112}, {20, 46.7955}}
```

\dataplotTXT{data.txt}{ListLinePlot}{dataplot}

```
\begin{figure}[h!]
\centering
\includegraphics[width=0.6\textwidth]{dataplot.png}
\caption{Plot of random dataset stored in a separate file}
\end{figure}
```

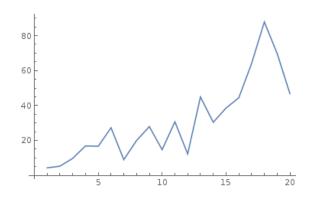

Figure 5: Plot of random dataset stored in a separate file

dataplot TXT takes an optional fourth argument in which you can specify plot options.

```
\dataplotTXT{data.txt}{ListLinePlot}{dataplotstyled}{Frame -> True, Axes -> False,
PlotStyle -> (Red, Thick, Dotted),
FrameLabel -> (Style['x-axis Label', 12, FontFamily -> Arial],
Style['y-axis Label', 12, FontFamily -> Arial])}
\begin{figure}[h!]
\centering
```

\includegraphics[width=0.6\textwidth]{dataplotstyled.png}
\caption{Styled plot of random dataset stored in a separate file}
\end{figure}

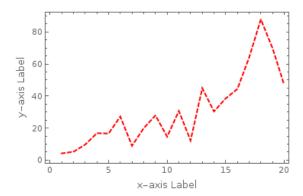

Figure 6: Styled plot of random dataset stored in a separate file

A couple notes on syntax: In the plot specifications, you'll notice that single quotation marks, ('), have been used as a string delimiter rather than double, ("). This is necessary. Additionally, lists have been specified by regular parentheses rather than the usual Wolfram style of curved ({ }) parentheses.

Tips for Graphics

- Once a graphic has been generated and saved to your computer, it is best to comment out the \graphic line to reduce compile time. Be careful, however, that if you are doing this, you are not reusing names for graphics.
- If you wish to show multiple functions or datasets in one graphic, the Wolfram function Show[] allows for this. For example, $Show[Plot[x,{x,0,1}],ListPlot[data]]$ will plot the line y=x overtop the dataset data.

Wolfram Alpha

Additionally, LATEX- α can take Wolfram Alpha input and insert the results into your document.

The biggest city in Canada is \$\WolframAlpha{ biggest city in Canada }\$.

The biggest city in Canada is Toronto.

The Empire State Building is \$\WolframAlpha{ how tall is the empire state building}\$ tall.

The Empire State Building is 1250 Feet tall.
